1 Introduction

1.1 Background

This project is located along Buffalo Creek in the Town of West Seneca, NY (Town) upstream of the confluence with Cayuga Creek. The Town is located just outside of Buffalo, NY and covers an area of approximately 21 square miles. It is transected by nine (9) major highways, including the NY State Thruway, which makes it an ideal location for both residential and commercial development. The Town has experienced a long history of flooding damages and impacts associated with rapid snowmelt, heavy rainfall, and ice jams. Some of the largest of these impacts are cited as occurring along the Buffalo Creek corridor.

The Lexington Green neighborhood sits along a bend in Buffalo Creek approximately 0.7 miles upstream of its confluence with Cayuga Creek at the Harlem Road Bridge. Buffalo Creek runs along the north and east sides of the neighborhood over a length of approximately 0.45 miles. The neighborhood was developed in the mid-1960s on top of the former Buffalo Creek channel, which was filled with gravel and excavated materials from a sediment control project. Approximately 90 homes were built within the neighborhood, all of which are still occupied as of 2022.

Historically, the neighborhood has been susceptible to flooding since its development in the mid-1960s, particularly ice jams in the late winter to early spring. During the period from March 1979 to January 2014, the neighborhood did not experience any major flood events. In the winter of 2014, two 1-percent annual exceedance probability (AEP) storm events (i.e., 100-year recurrence interval) occurred within 6 weeks of each other in January and February causing a combined damage estimate of \$1.2 million (USACE 2016). In the winter of 2019, a significant ice-jam flooding event caused the evacuation of the School Street Neighborhood. Most recently, in the winter of 2022, a severe flooding event caused emergency evacuations of several neighborhoods in the Town of West Seneca along Buffalo Creek.

1.2 Objectives

Ramboll was tasked with identifying opportunities for reconnecting Buffalo Creek to its floodplain to address reoccurring residential open-water and ice-jam flooding, improve flood resiliency, and to develop preliminary designs based on verified on-the-ground opportunities in the vicinity of the Lexington Green neighborhood. Ramboll performed a preliminary analysis of flood mitigation benefits from flood benches along Buffalo Creek in the vicinity of the Lexington Greene neighborhood. The purpose of this technical memorandum is to provide a summary of the evaluated flood bench scenarios.

2 Methodology

2.1 Hydrologic & Hydraulic (H&H) Model

The effective FEMA H&H model was obtained and evaluated for this modeling effort. According to the Flood Insurance Study (FIS) for Erie County, NY (2021), the H&H analysis for Buffalo Creek in the Town of West Seneca was completed by FEMA in 1976 and then revised and updated in 1992.

The H&H model developed by FEMA was created using the United States Army Corps of Engineers (USACE) Hydrologic Engineering Center River Analysis System (HECRAS) program (USACE 2021). The effective FEMA model was clipped down to the project area beginning at the confluence of Buffalo Creek

and Cayuga Creek to form the Buffalo River (river station 0+00) and extending upstream to the Buffalo Airfield (river station 205+00) (Figure 1).

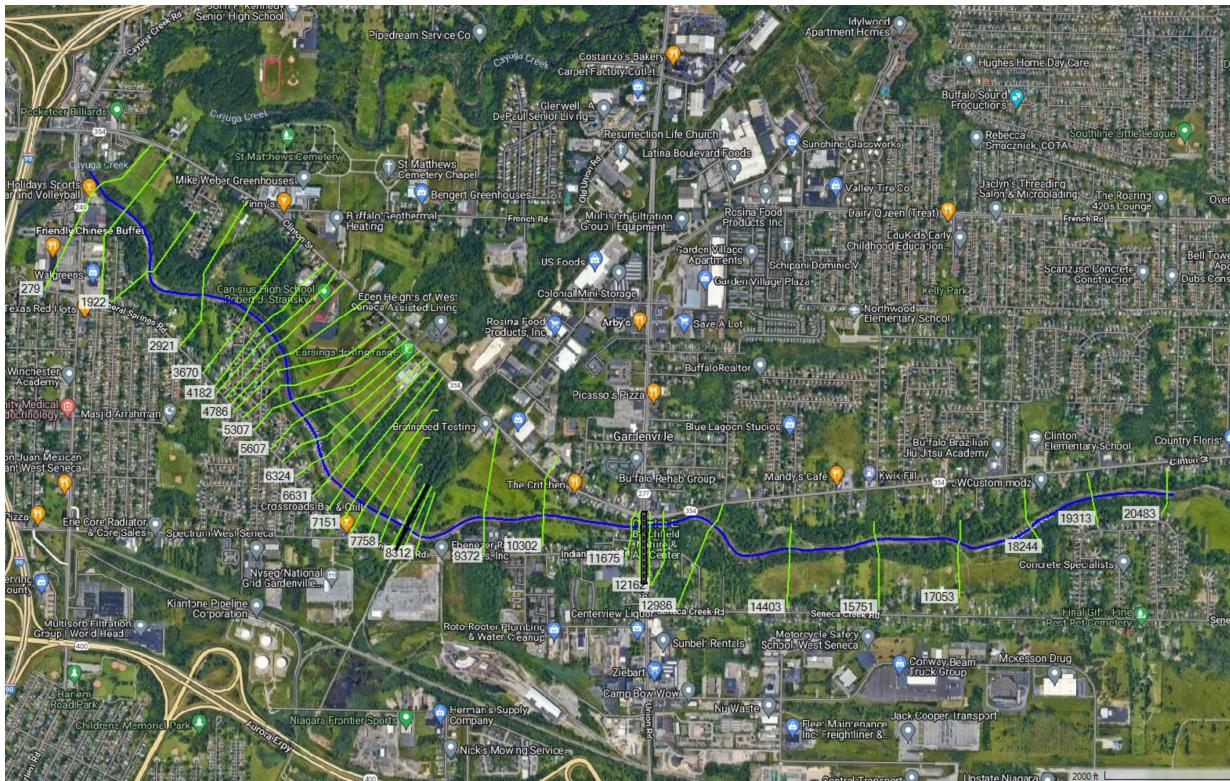

Figure 1. HEC-RAS Hydrologic & Hydraulic Model layout for Buffalo Creek.

2.2 Existing Conditions Model

The FEMA effective H&H model was obtained by Ramboll and used to develop the existing conditions model. Due to the age of the effective FEMA model (first developed in 1976), the overbank terrain and Manning's n values were outdated and, in some areas, incorrect due to land cover changes over time.

Using the latest LiDAR digital elevation model (DEM) and land cover data, the geometry from each cross section in the effective FEMA model had the overbank and channel geometries cut from the DEM terrain and the Manning's n value roughness coefficients assigned based on land cover type (NYSOITS 2019; USGS 2021). Since the DEM is a hydro-corrected model, any areas with open channels and water were assigned a single elevation across the channel since the LiDAR technology used to collect the terrain data cannot penetrate water accurately. As a result, the minimum channel elevation of each cross section was modified to match the channel elevation from the effective FEMA model or FIS profile plot.

In addition, 12 cross sections were added to the effective model between river stations 36+50 and 80+00 to provide the necessary starting and ending positions for the different flood bench scenarios. These new cross sections had their overbank and channel terrains set to the DEM data and the minimum channel elevations were modified to match the channel elevation from the FEMA effective model and FIS profile plot.

2.3 Model Input Data

The following data was obtained and utilized for the H&H modeling efforts:

- FEMA effective H&H model for Buffalo Creek (FEMA 2021)
- FEMA peak discharges (FEMA 2021)
- USGS *StreamStats* peak discharges (USGS 2021)
- New York State Digital Ortho-Imagery Program imagery (NYSOITS 2021)
- National Land Cover Database (NLCD) data (USGS 2021)
- NYSDOT bridge data (NYSDOT 2019)
- New York State 1-meter LiDAR digital elevation model (DEM) data with vertical accuracy of 19.6-centimeters (7.7 inches) in the North American Vertical Datum of 1988 (NAVD88) (NYSOITS 2019)

The hydrologic input data that was used by FEMA in the effective conditions model was peak discharges calculated using the methodology outlined in USGS Water Resources Investigations (WRI) 79-83 (USGS 1979), for un-gaged sites on gaged streams. For the western region of New York, the following equation is used:

$$Q = K(DA)^x(St + 10)^y$$

Where Q is the stream discharge; DA is the drainage area; St is the percent of total drainage area stored in lakes, ponds and swamps; and K, x and y are variables of the frequency with specific values assigned based on the recurrence interval. For the western flood-frequency region, New York, which includes Buffalo Creek, the 1-percent AEP values for K, x, and y are 49,900, 0.733, and 2.03, respectively. Calculated peak discharges were then adjusted using regression equations calculated at the gage station at Gardenville (FEMA 2021).

In the FIS, only the 1-percent AEP event was determined by FEMA, which was 16,000 cubic feet per second (cfs). To evaluate existing and proposed conditions along Buffalo Creek, it was necessary to obtain discharge data for the 10-, 2-, 1-, and 0.2- percent AEP events (10, 50, 100, and 500-year recurrence intervals). Hydrologic data was obtained from the USGS *StreamStats* software since there was limited available FEMA data for Buffalo Creek within the project area.

The USGS *StreamStats* v4.10.1 software (<https://streamstats.usgs.gov/ss/>) is a map-based web application that provides an assortment of analytical tools that are useful for water resources planning and management, and engineering purposes. The primary purpose of *StreamStats* is to provide estimates of streamflow statistics for user-selected un-gaged sites on streams and for USGS stream gages, which are locations where streamflow data are collected (Ries et al. 2017, USGS 2022). Table 1 displays the peak streamflow data obtained from *StreamStats* for Buffalo Creek at the confluence with Cayuga Creek.

Table 1. USGS StreamStats Peak Streamflow for Buffalo Creek.

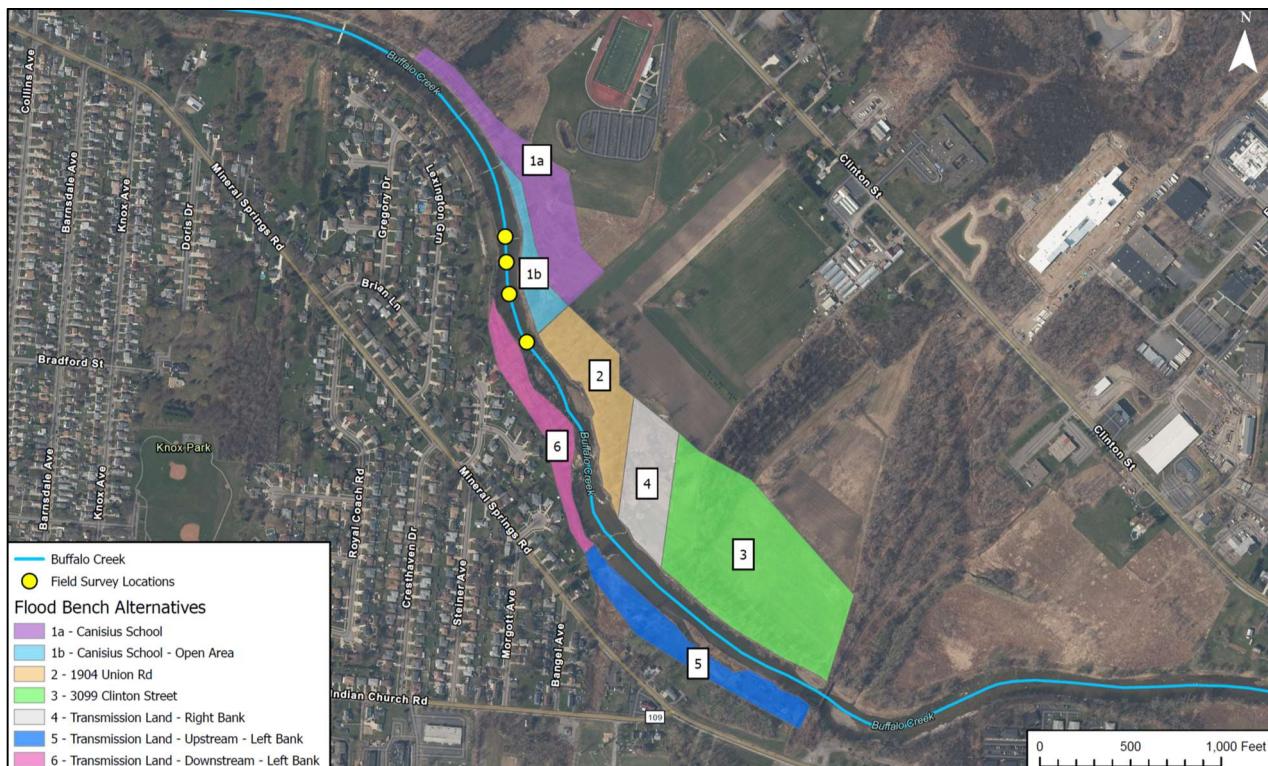

Location	Drainage Area (sq miles)	River Station (ft)	Peak Discharges (cfs)			
			10-Percent	2-Percent	1-Percent	0.2-Percent
Confluence with Cayuga Creek	146	0+00	7,990	11,800	13,600	18,000

2.4 Boundary Conditions

Downstream boundary conditions from the effective FEMA H&H model for Buffalo Creek used the Normal Depth method (FEMA 2021). Normal depth was calculated using the friction slope (S_f in Manning's equation), which is the slope of the energy grade line, and can be estimated by measuring the slope of the bed at the downstream reach (USACE 2022). For this model, the slope between the last three cross sections was used and calculated to be 0.00012.

2.5 Survey Data

Field staff from Ramboll performed a field visit on November 2, 2022, where overbank and in-channel survey data and streambank assessments were performed. Four locations in the vicinity of the Lexington Green neighborhood and Canisius High School fields were surveyed. Figure 2 displays the field survey locations along Buffalo Creek.

**Figure 2. Field survey locations along Buffalo Creek.**

Field surveys involved field staff using surveying and leveling equipment to measure land surface elevations perpendicularly across the creek channel from one overbank area to the other at the four identified locations from Figure 2. In addition, stream bank assessments were performed at each location to determine the condition and locations of overbank zones (e.g., toe, bank, overbank, transitional, and upland zones).

This survey data was incorporated into the H&H model for Buffalo Creek by modifying the cross-section geometry in the HEC-RAS model to match the field surveyed elevations. Attachment A contains the field notes from the field staff.

2.6 Overbank Modifications

Through public engagement and a meeting with Canisius High School, it was identified that the school is in the process of constructing two baseball fields, a practice field, and tennis courts in the open area adjacent to Buffalo Creek. The site plans and drawings for this construction was provided to Ramboll and incorporated into the H&H model for Buffalo Creek.

Since the new construction includes fill in the overbank area adjacent to Buffalo Creek, blocked obstructions were used in the H&H model to simulate the new fill and grade of the overbank area. Attachment B contains the site plans for the development.

2.7 Flood Bench Scenarios

Potential flood bench locations were identified using input received from the public engagement meeting and contact with individual property owners. Highland Planning, the public outreach and engagement sub-contractor for this project, took the lead in contacting and engaging with property owners to gauge interest in being included in this project. A public engagement meeting took place on August 22, 2022, where project members from Ramboll discussed the project goals and potential property owner participation.

Based on discussions and participation by the community and property owners, six potential flood bench configurations were identified along Buffalo Creek within the project area. Table 2 summarizes the different identified flood bench configurations with descriptions. Figure 3 displays the locations and extents of each flood bench scenario.

Table 2. Summary Table of Proposed Flood Bench Configurations

Flood Bench ID	Description
1a	Western portion of the Canisius School tax parcel
1b	Western portion of the Canisius School tax parcel (outside of proposed site plans)
2	Western portion of the 1904 Union Rd tax parcel
3	Western portion of the 3099 Clinton Street tax parcel
4	Western portion of the Transmission Land (Right Bank) tax parcel
5	Western portion of the Transmission Land (Upstream – Left Bank) tax parcel
6	Western portion of the Transmission Land (Downstream - Left Bank) tax parcel

**Figure 3. Location map of Buffalo Creek and the flood bench scenarios.**

Based on the six identified flood bench locations, ten flood bench scenarios of different configurations were developed and modeled using the HEC-RAS modeling software. Table 3 outlines the ten flood bench scenarios.

Table 3. Summary table of modeled flood bench scenarios.

Scenario ID	Flood Bench Configurations
1	1a
2	1b
3	1b + 2
4	2 & 3
5	1b + 2 + 3
6	2 + 3 + 4
7	1b + 2 + 3 + 4
8	5 + 6
9	1b + 2 + 3 + 4 + 5 + 6

The modified effective FEMA model, referred to hereafter as the existing conditions model, and the proposed scenario model were run using the FEMA FIS peak discharge data. Attachment C contains the HEC-RAS model simulation results for the existing conditions models.

2.8 Proposed Scenario Modeling

Using the HEC-RAS modeling software, proposed conditions models were developed for each flood bench configuration based on the existing conditions model developed from the FEMA effective model. To model flood bench scenarios, terrain modifications were made to each cross section that intersected a proposed flood bench. Figure 3 displays an example cross section where the overbank terrain was modified to represent a flood bench.

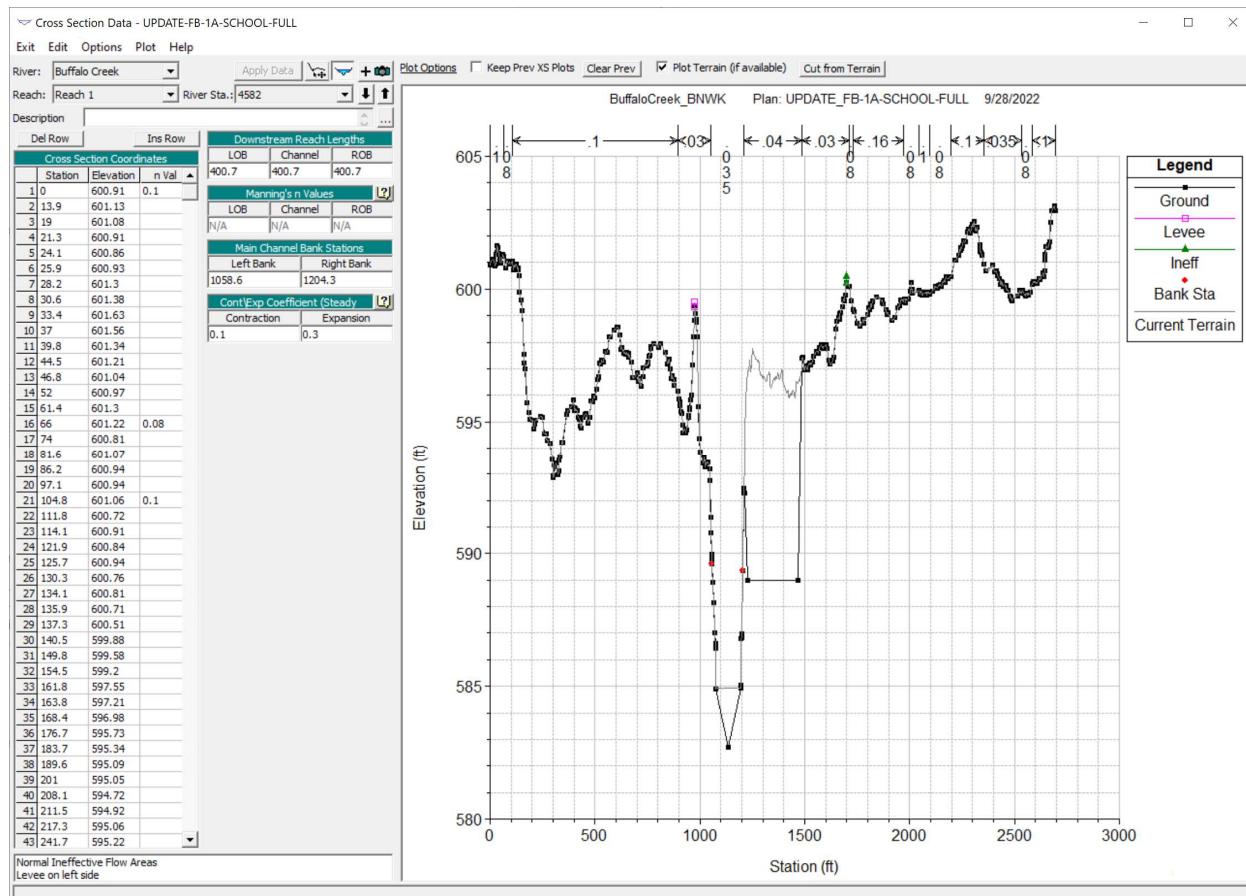

Figure 4. Example Cross-Section from HEC-RAS Depicting a Flood Bench.

3 Results

3.1 Effective FEMA versus Existing Conditions Models

Table 4 outlines the results of the effective FEMA and Existing Conditions models.

Table 4. HEC-RAS Model Results for the FEMA FIS 1-Percent Peak Discharge

River Station (ft) Effective/Existing	Water Surface Elevation (ft NAVD88)		
	Effective FEMA	Existing Conditions	Difference Effective - Existing
20473/20483	635.1	634.5	0.6

8016/7984	606.4	606.6	-0.3
7906	606.3	N/A	N/A
7758	N/A	606.3	N/A
7564	N/A	605.9	N/A
7340	N/A	605.5	N/A
7140/7151	603.3	604.9	-1.6
6890	N/A	604.3	N/A
6631	N/A	602.8	N/A
6324	N/A	601.7	N/A
6009/6015	599.5	600.1	-0.6
5607	N/A	599.1	N/A
5307	N/A	598.4	N/A
5051	N/A	597.6	N/A
4785/4786	597.8	596.6	1.2
4582	N/A	595.7	N/A
4363	N/A	594.6	N/A
4182	N/A	594.0	N/A
3997	N/A	593.5	N/A
3686/3670	594.0	593.5	0.5
2949/2921	592.7	591.4	1.3
1922/1922	591.5	590.8	0.7
866/833	589.6	590.0	-0.4
279	588.9	588.9	0.0

The differences between the effective and existing conditions models are a result of multiple factors, including:

- Updated overbank and channel geometry using the most current DEM available
- Updated Manning's n values in the overbank areas to represent land use changes over time in the watershed
- The additional cross-sections in the project area providing more consistent and higher resolution hydraulic calculations and output data

3.2 Scenario Modeling Results

Table 5 summarizes the results of the flood bench scenario modeling between the Existing and Proposed Conditions Models.

Table 5. Results of the Proposed Conditions Models.

Scenario ID	Flood Bench Configurations	Reductions in Water Surface Elevations (ft NAVD88)			
		10-Percent	2-Percent	1-Percent	0.2-Percent
1	1a	0.4	0.6	0.7	0.7
2	1b	0.4	0.5	0.6	0.6
3	1b + 2	0.8	1.2	1.2	1.3
4	2 + 3	1.4	1.6	1.6	1.6
5	1b + 2 + 3	1.4	1.6	1.6	1.6
6	2 + 3 + 4	1.5	2.0	2.2	2.4

4 Conclusion

Based on the results of the H&H modeling, there are multiple flood bench configurations that could provide significant flood mitigation benefits to the Lexington Green neighborhood and surrounding areas. The top three scenarios that produced the largest reduction of water surface elevations were:

1. [Scenario #9](#): Up to 2.8-ft of modeled water surface elevation reductions
2. [Scenario #7](#): Up to 2.5-ft of modeled water surface elevation reductions
3. [Scenario #6](#): Up to 2.4-ft of modeled water surface elevation reductions

Scenario #9 involved utilizing flood benches from all 6 proposed locations, while Scenario #7 involved flood benches 1b, 2, 3, and 4 and Scenario #6 involved flood benches 2, 3, and 4. None of the remaining scenarios exceeded 2-ft of water surface elevation reductions, with Scenarios #1, 2, and 8 producing the lowest water surface elevation reductions of less than 1-ft.

The common element between the top three scenarios was the involvement of flood benches 2, 3, and 4. As of November 2022, the landowners for flood benches 2 and 3 have expressed interest in pursuing flood mitigation projects on their properties, such as the proposed flood benches.

Flood bench 4 involves land owned by National Grid and contains utility equipment and transmission lines. Any flood mitigation project involving this land would require permission and coordination with National Grid. As of November 2022, the project team and Buffalo Niagara Waterkeepers were in contact with company representatives regarding potential interest in pursuing a flood mitigation project.

Flood benches 1a and 1b involve land owned by Canisius High School. As of November 2022, the school has started construction on the two new baseball fields, practice field, and tennis courts. Flood bench 1a would involve land being used for this new construction and, as such, would most likely not be supported by the school. Flood bench 1b does not involve land impacted by the new construction and may be potentially supported by the school. As of November 2022, the project team and Buffalo Niagara Waterkeepers were in discussions with school representatives regarding potential interest in pursuing a flood mitigation project, such as flood bench 1b.

Based on the analysis performed in this study, the Project Team recommends Scenario #6 be considered for advancement. Scenario #6 provided significant and measurable flood mitigation benefits based on the H&H modeling simulations and requires the least number of property owner participants. In addition, the property owners for flood benches 2 and 3 have expressed interest in participating in the project during individual and the public engagement meeting. Figure 14 displays the location and extent of the flood benches for Scenario #6. Attachment D displays a sectional view for the flood benches that comprise Scenario #6.

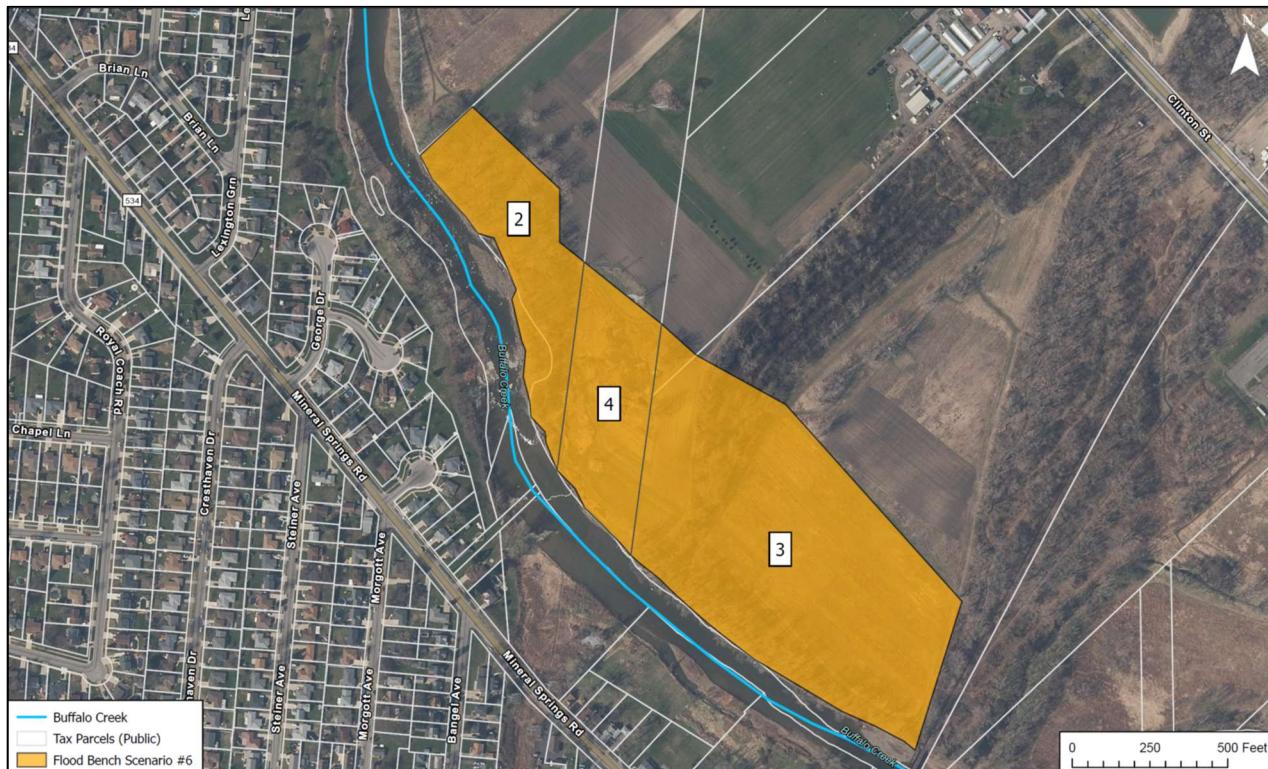

Figure 14. Flood bench locations and extent for Scenario #6.

There are some potential constraints to Scenario #6 that should be considered by the Project Team and community moving forward. The property owner of flood bench 4 is National Grid, which has transmission line equipment and towers within the proposed flood bench area. Coordination and buy-in from National Grid, in conjunction with design plans that mitigate any impacts to their utility equipment and towers, would be necessary to progress Scenario #6. The availability of potential State and/or Federal funding through grants, loans, awards, etc. would also need to be considered. Finally, the Oxbow along Buffalo Creek downstream of the Lexington Green neighborhood is a protected wetland so coordination with the New York State Department of Environmental Conservation (NYSDEC) would be necessary for any flood mitigation project along Buffalo Creek in the project area.

ATTACHMENT A: FIELD NOTES

November 2nd - Buffalo Creek field
work

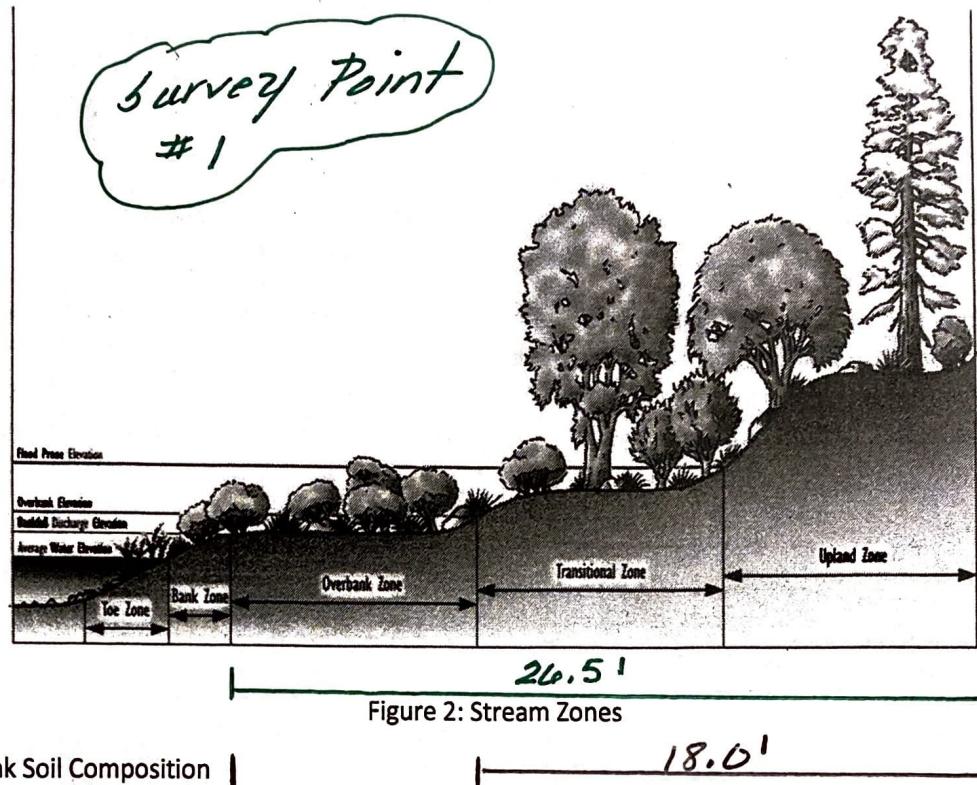

Personnel - Lexi Hackford & Michelle
McEntire

Benchmark was sill #5 - crest elevation
of 585.7' based on USACE Document
attached

**Survey
Point #1**

	BS	HI	FS	ELEV.	Description
	14.71			585.7'	BM = Crest of sill #5
*		400.40'		584.60'	Bottom of Creek (upstream of sill)
*			15.8'	584.4'	Bottom of Creek (downstream of sill)
			16.0'	586.9'	Bankfull Elev. (Top Bank Zone)
			11.3'	589.1'	overbank Elev. (Top of overbank)
			4.5'	595.9'	upland Elev. (where surveyor laser was.)

* These water bottom elevations were taken
from 30'-40' out into the water with
Michelle standing on the sill.

Step 3 – Bank Soil Composition

18.0'

Instructions: Visually and tactiley (i.e., using your hands / trowel) assess the relative size of the bank material. Record the type of stratification using the Soil Stratification in the figure below. Assign percent of sub-reach length to each material category. Note that cohesive banks are composed of soil, which has a certain percentage of silt and clay. Non-cohesive banks lack silt and clay, though can be a mixture of sands, gravel, cobbles, etc. Table 1 contains descriptions and lengths associated with each sediment class. Using Figure 1, columns 3 and 4 as reference for recording observations on bank stratification and composition.

GPS enabled pictures should be taken from a head on view that clearly shows any stratification.

Table 1. Grain size descriptions

Type	Cohesive		Non-Cohesive		
	Silt / Clay (soil)	Sand	Gravel	Cobble	Boulder
Grain Size	< 0.062 mm	0.063 to 2 mm	2 to 64 mm	64 to 256 mm	256 + mm
Description	Fine texture, cohesive, smooth when rubbed between fingers	Fine sugar to kosher salt sized particles	Peppercorn to egg sized	Baseball to grapefruit sized	Melon sized and larger

Step 4 – Bank Angle and Shape

Instructions: The bank angle categories are as follows: Mild (0°-30°), Moderate (30°-60°), Steep (60°-90°), and Overhang (> 90°). Evaluate percent of each sub-reach having each bank angle category. Bank Shape is focused on the potential for or evidence of erosion. Record the "shape" using Figure 1, column 2.

The top of Sill #5 was used as the benchmark for the second survey location.

Survey Point #2

<u>BS</u>	<u>HT</u>	<u>FS</u>	<u>Elev.</u>	<u>Description</u>
12.8'			585.7'	BM = Crest of Sill #5
	598.50'			
		9.9'	588.10'	Bottom of creek right @ edge
		8.7'	589.8'	Top of bank
		0.8'	591.7'	Bankfull Elev. (Top of Bank Zone)
		4.1'	594.4'	Overbank Elev. (where survey laser was)

Unfortunately, no length measurements were taken @ this spot due to the density of the trees & grass.

There wasn't a clear overbank, transitional & upland zone. One zone covered all three of zones & was very gradually sloping.

To get to the next creek survey location, we needed to use an intermediate survey location to get us down the creek.

<u>BS</u>	<u>HI</u>	<u>FS</u>	Elev.	<u>Description</u>
598.50'	4.9'	591.6'	location / spot where survey equip. will be moved to.	591.6'

Survey equipment was now moved to this location. Instrument Height was 4.2'. To get to the next creek survey location, we needed to move the survey equip. again.

<u>BS</u>	<u>HI</u>	<u>FS</u>	Elev.	<u>Description</u>
$= 591.6' + 4.2'$	5.7'	590.1'	location / spot where the survey equip. was moved to.	$= 595.8'$

Survey location #3

<u>BS</u>	<u>HI</u>	<u>FS</u>	<u>ELEV.</u>	<u>Description</u>
<i>(Survey location #4)</i>				
	= 590.1' + 4.2'			
	= 594.3'			
		12.8'	581.5'	In the water along the bank
	10.8'		583.5'	Bankfull ELEV. <small>(Top of Bank zone)</small>
	7.1'		587.2'	overbank ELEV. <small>(Top of overbank)</small>
	5.6'		588.7'	Upland ELEV. <small>(closer to where the survey equip. was)</small>

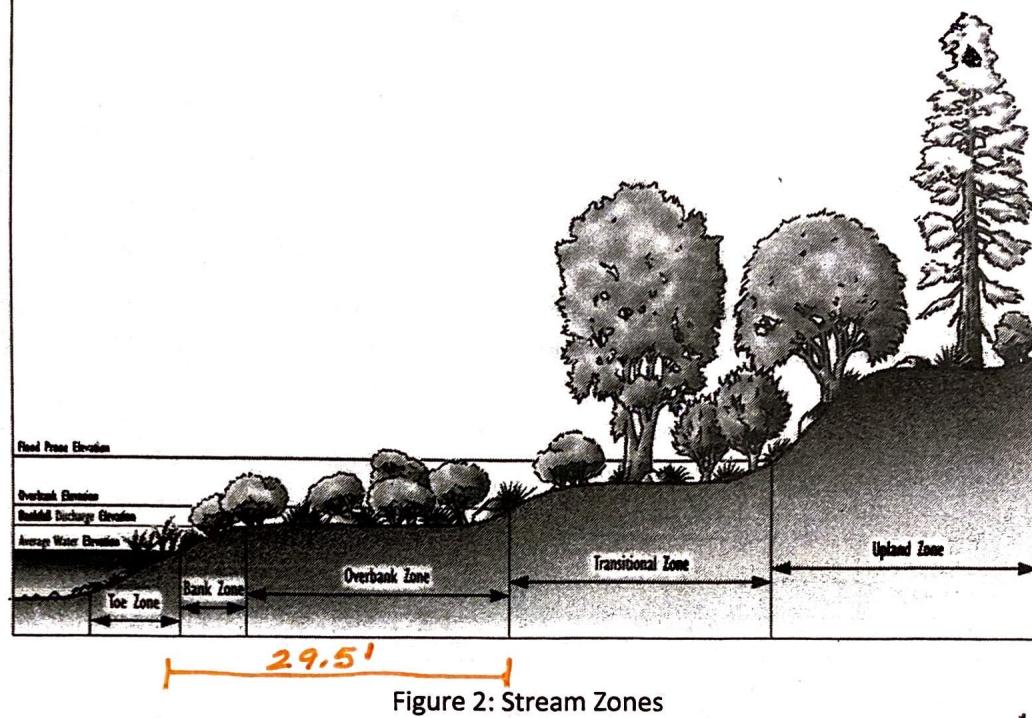

Figure 2: Stream Zones

Step 3 – Bank Soil Composition

62.0'

Instructions: Visually and tactiley (i.e., using your hands / trowel) assess the relative size of the bank material. Record the type of stratification using the Soil Stratification in the figure below. Assign percent of sub-reach length to each material category. Note that cohesive banks are composed of soil, which has a certain percentage of silt and clay. Non-cohesive banks lack silt and clay, though can be a mixture of sands, gravel, cobbles, etc. Table 1 contains descriptions and lengths associated with each sediment class. Using Figure 1, columns 3 and 4 as reference for recording observations on bank stratification and composition.

GPS enabled pictures should be taken from a head on view that clearly shows any stratification.

Table 1. Grain size descriptions

Cohesive		Non-Cohesive			
Type	Silt / Clay (soil)	Sand	Gravel	Cobble	Boulder
Grain Size	< 0.062 mm	0.063 to 2 mm	2 to 64 mm	64 to 256 mm	256 + mm
Description	Fine texture, cohesive, smooth when rubbed between fingers	Fine sugar to kosher salt sized particles	Peppercorn to egg sized	Baseball to grapefruit sized	Melon sized and larger

Step 4 – Bank Angle and Shape

Instructions: The bank angle categories are as follows: Mild (0° - 30°), Moderate (30° - 60°), Steep (60° - 90°), and Overhang ($> 90^\circ$). Evaluate percent of each sub-reach having each bank angle category. Bank Shape is focused on the potential for or evidence of erosion. Record the "shape" using Figure 1, column 2.

Stream Assessment Protocol Form

Step 1 — Wollman Pebble Count — use additional form

LOCATION 1

Step 2 — Bank Vegetation Assessment: Record Percentage of Bank Covered by Ground Cover, record presence of absence of roots in, on or exposed.

Zone	Percent Coverage	Description
Bank	90/10	grasses, bushes / Rock
Stream Edge	100%	grasses
Overbank	90/10	few exposed roots grasses, bushes / Rock

Step 3 — Bank Soil Assessment: Count the total number of stratifications, record the total and then complete the table to record the type from Table 1 of the instructions and description of relevant features.

Number of total Stratifications 2

Stratification No.	Type	Description
1 (bottom)	cohesive	dark, clay /
2	boulder	boulders, patches that look like concrete

Step 4 – Bank Angle: Select one of the following and record the type in the space provided

Bank Angle Type	Check the appropriate One Below
Mild (0° - 30°)	
Moderate (30° - 60°)	<input checked="" type="checkbox"/>
Steep (60° - 90°)	
Overhang ($> 90^{\circ}$)	

Record the Type per the figure provided in the instructions Medium

Step 5 – Evidence of Bank Failure / Bed Stability: Selected one of the following and record the type and provide and relevant description.

Bank Angle Type	Check the appropriate One Below	Type	Description
Low (0 – 25%)			
Moderate (25 – 50%)	<input checked="" type="checkbox"/>	C	Some exposed roots, no fresh erosion
High (50 – 75%)			
Severe (70 – 100%)			

Stream Assessment Protocol Form

Step 1 — Wellman Pebble Count — use additional form

Survey Point 2

Step 2 — Bank Vegetation Assessment: Record Percentage of Bank Covered by Ground Cover, record presence of absence of roots in, on or exposed.

Zone	Percent Coverage	Description
Bank	100	grasses, bushes
Stream Edge	100	grasses, bushes
Overbank	80/20	grasses/trees no exposed roots

Step 3 — Bank Soil Assessment: Count the total number of stratifications, record the total and then complete the table to record the type from Table 1 of the instructions and description of relevant features.

Number of total Stratifications _____

Stratification No.	Type	Description
1	cohesive	clay loam

Step 4 – Bank Angle: Select one of the following and record the type in the space provided

Bank Angle Type	Check the appropriate One Below
Mild (0°-30°)	
Moderate (30°-60°)	X
Steep (60°-90°)	
Overhang (> 90°)	

Record the Type per the figure provided in the instructions Ian

Step 5 – Evidence of Bank Failure / Bed Stability: Selected one of the following and record the type and provide and relevant description.

Bank Angle Type	Check the appropriate One Below	Type	Description
Low (0 – 25%)	X	C	no exposed roots or evidence of erosion
Moderate (25 – 50%)			
High (50 – 75%)			
Severe (70 – 100%)			

Stream Assessment Protocol Form

Step 1 - Wellman Pebble Count - use additional form

Survey point 3 (^{location}_{#4 on Survey}) ²⁰⁵

Step 2 - Bank Vegetation Assessment: Record Percentage of Bank Covered by Ground Cover, record presence of absence of roots in, on or exposed.

Zone	Percent Coverage	Description
Bank	70/30	70% grasses 30% dirt/rock trail a few roots exposed from overbank trees
Stream Edge	90/10	grasses/rock
Overbank	90/10	grasses/trees no exposed roots

Step 3 - Bank Soil Assessment: Count the total number of stratifications, record the total and then complete the table to record the type from Table 1 of the instructions and description of relevant features.

Number of total Stratifications 1

Stratification No.	Type	Description
1	cohesive	Clay loam with scattered boulders

Step 4 – Bank Angle: Select one of the following and record the type in the space provided

Bank Angle Type	Check the appropriate One Below
Mild (0°-30°)	X
Moderate (30°-60°)	
Steep (60°-90°)	
Overhang (> 90°)	

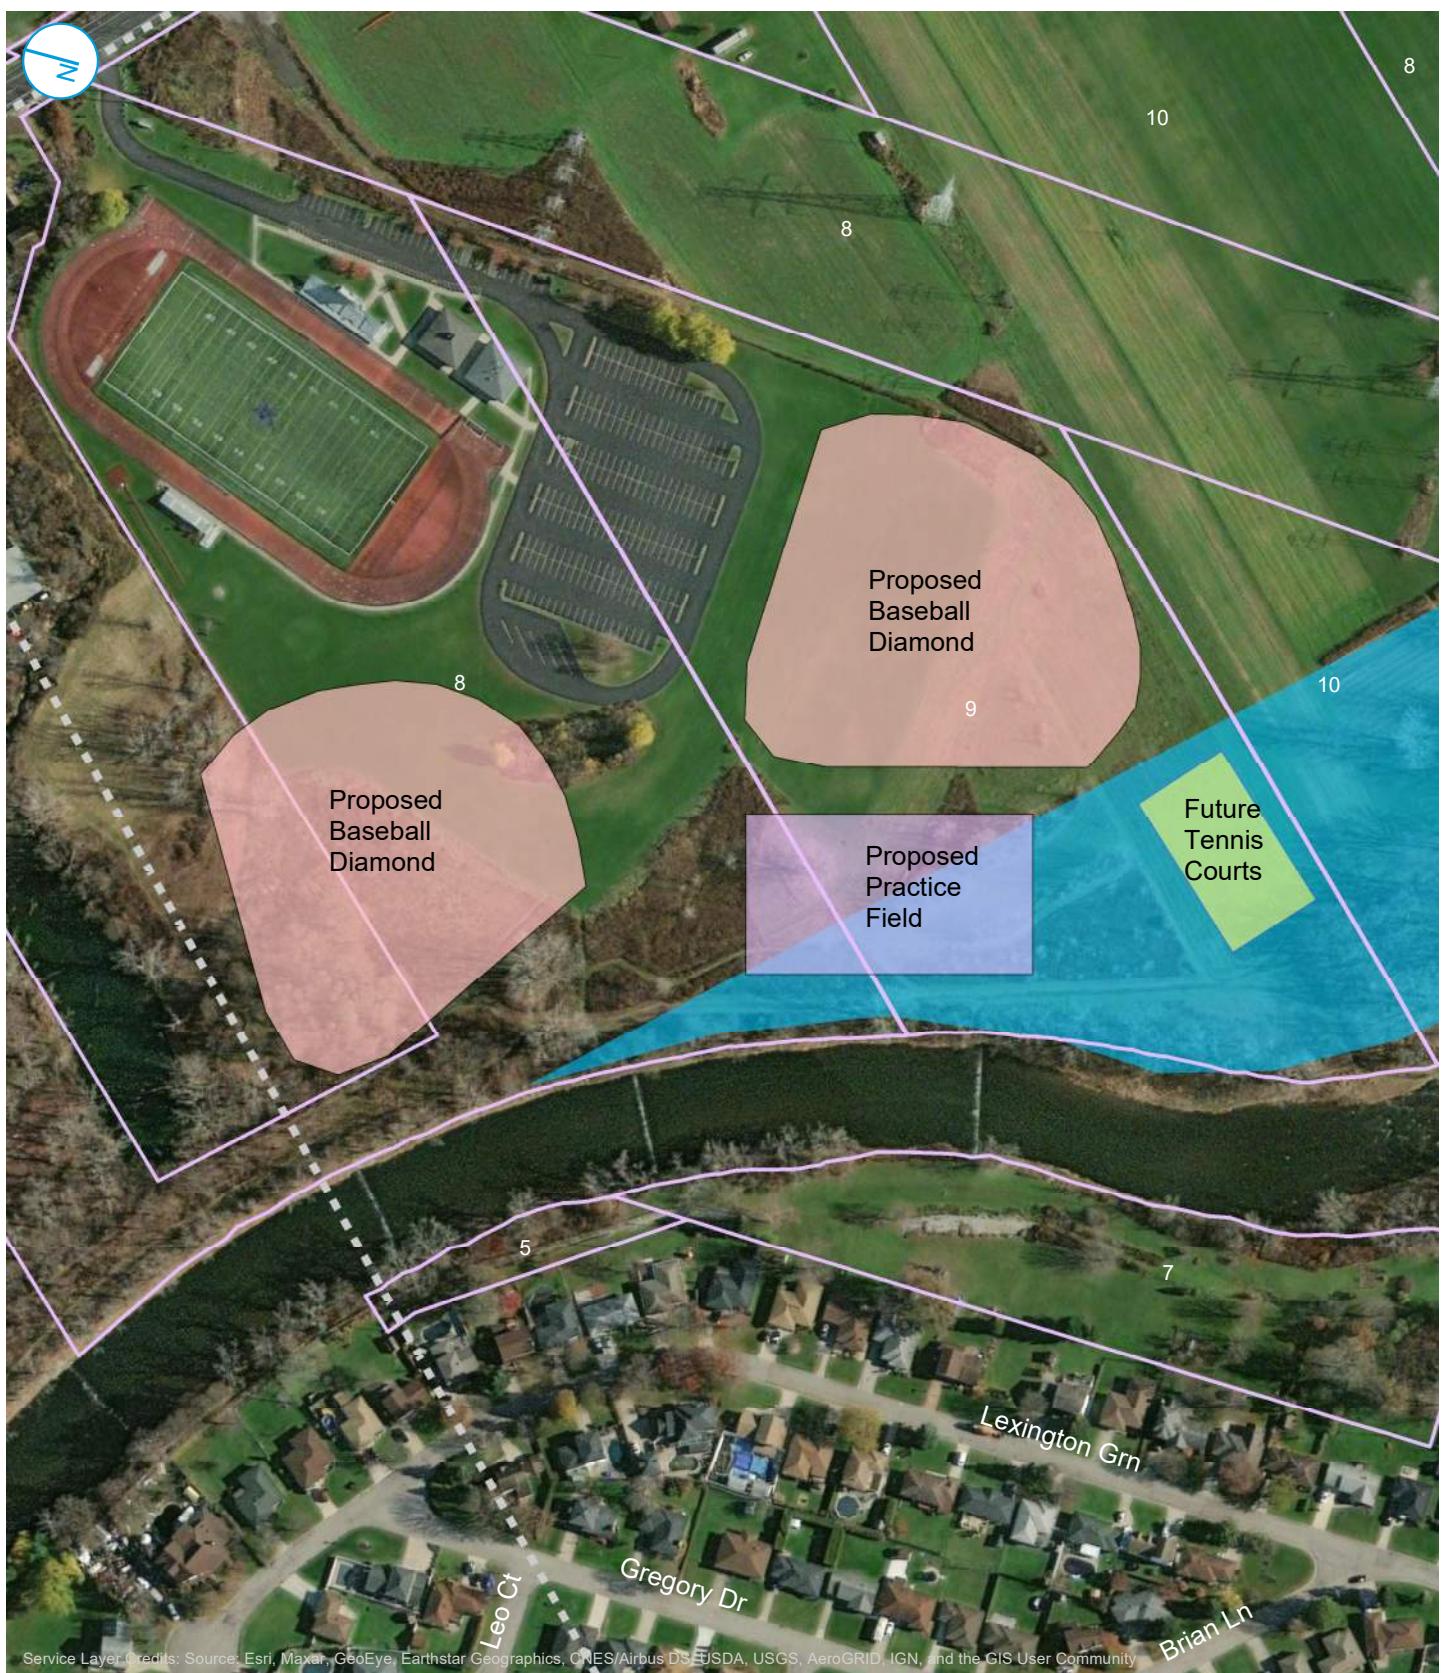

Record the Type per the figure provided in the instructions Low

Step 5 – Evidence of Bank Failure / Bed Stability: Selected one of the following and record the type and provide and relevant description.

Bank Angle Type	Check the appropriate One Below	Type	Description
Low (0 – 25%)	X	A	minor root exposure (single) tree
Moderate (25 – 50%)			
High (50 – 75%)			
Severe (70 – 100%)
